EXPERIMENT 09

Exploring AI-assisted features and built-in analytics (Zia) in Zoho Creator.

Student details	Project details
HARIHARAN N Register No. 241401024	Insurance Claim Request & Processing Management
Department: CSBS	Platform: Zoho Creator (India region)
Institution: Rajalakshmi Engineering College	Evidence / verification date: 19 October 2026

Aim

To explore Zia assistance and application analytics, interpret insurance-claim trends, and verify AI guidance against actual records and reports.

Execution status

Zia guidance explored and cross-checked with live application analytics. Existing dashboard and reports were used; a new native pivot chart was not completed.

Application context

The project records insurance requests, validates submitted details, assigns claims for processing and presents claim status and amount summaries. Existing forms, reports, Deluge workflows and permission profiles provide the base for this experiment.

Screenshots in this report are actual captures from the project account. Explanations, tables and code listings are documentation, not simulated platform screenshots.

Procedure and observations

1. Opened the insurance application and its Zia / Build Agent assistant. Requested analysis guidance without component or record changes.

2. Asked how to group claims by Claim_Type and Claim_Status and identify records requiring processing.

3. Read the response and its limitations. The assistant stated that it could not provide verified live record counts.

4. Opened Claims_Dashboard and Pending_Claims_Report and compared displayed totals with the filtered report.

5. Used separate Development records to demonstrate status changes without altering Production claims.

Measure	Observed Production value
Total claims / requiring processing	11 / 8
Approved claims	3
Requested / approved amount	INR 1,410,450 / INR 100,000
Status distribution	5 Submitted; 3 Under Review; 3 Approved
Type distribution	4 Motor; 1 Health; 1 Life; 1 Property; 1 Travel; 3 Other

Interpretation

The eight open claims are the Submitted and Under Review records. Amount totals summarize recorded requests; they do not predict eligibility or insurance liability. Counts reflect the captured test dataset, not a general business population.

Evidence: AI assistance

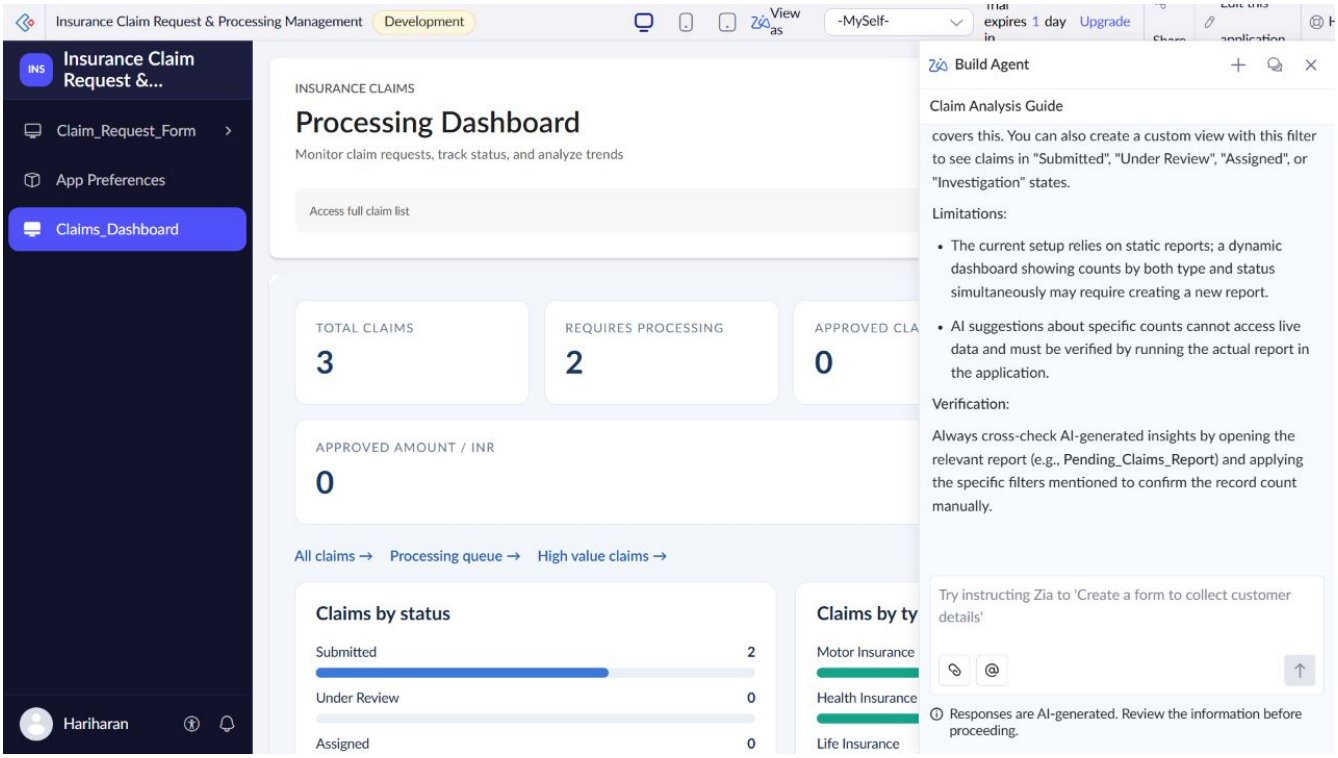

Figure 9.1 - Actual Zia guidance and stated limitations alongside the Development application.

AI verification

Zia suggested grouping and filtering, but its suggestion that a new dynamic dashboard was needed did not describe the existing custom dashboard accurately. The dashboard already displayed live aggregates. This demonstrates why generated advice must be checked against application components before changes are made.

Responsible use

Use synthetic or minimized data in exploratory prompts. Do not use an AI response as an insurance approval, rejection or authoritative count. Verify fields, criteria, permissions and outputs using the application itself.

Evidence: analytics and result

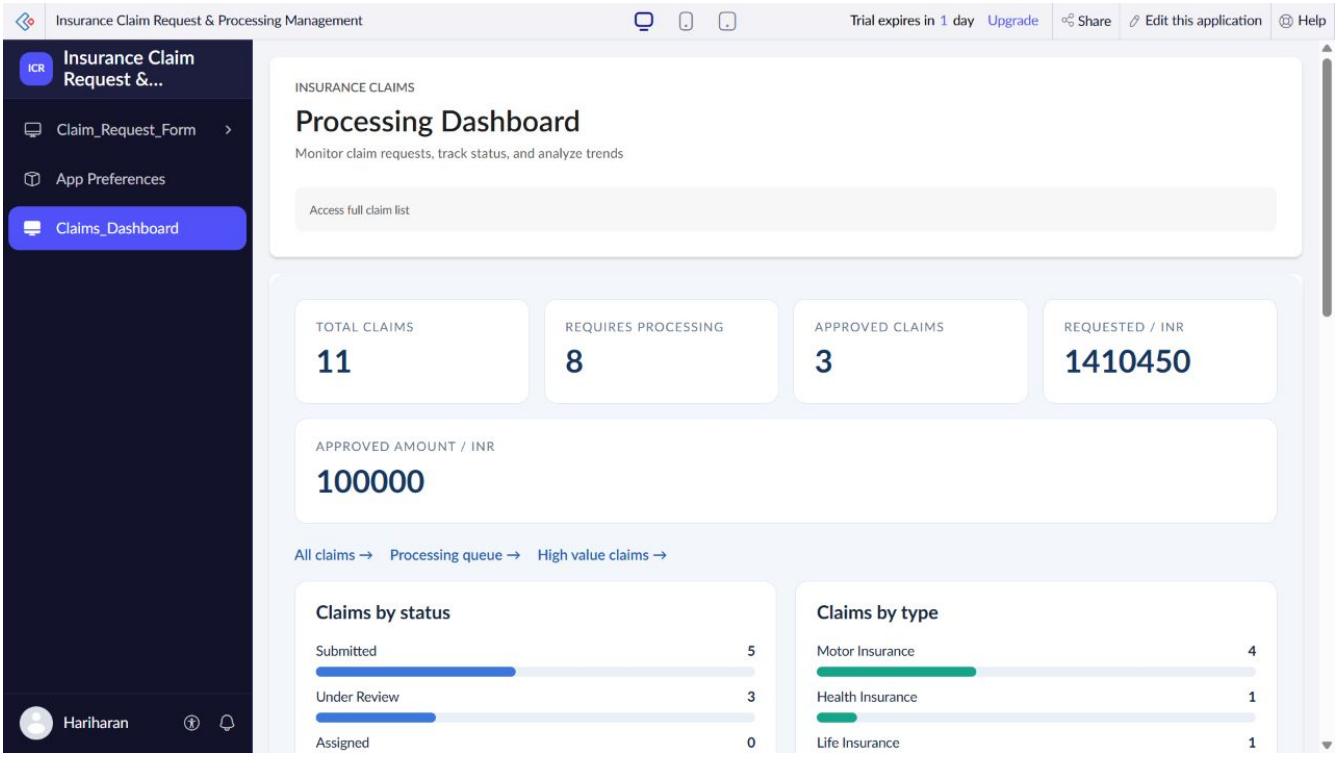

Figure 9.2 - Production dashboard showing claim totals, pending workload and amounts.

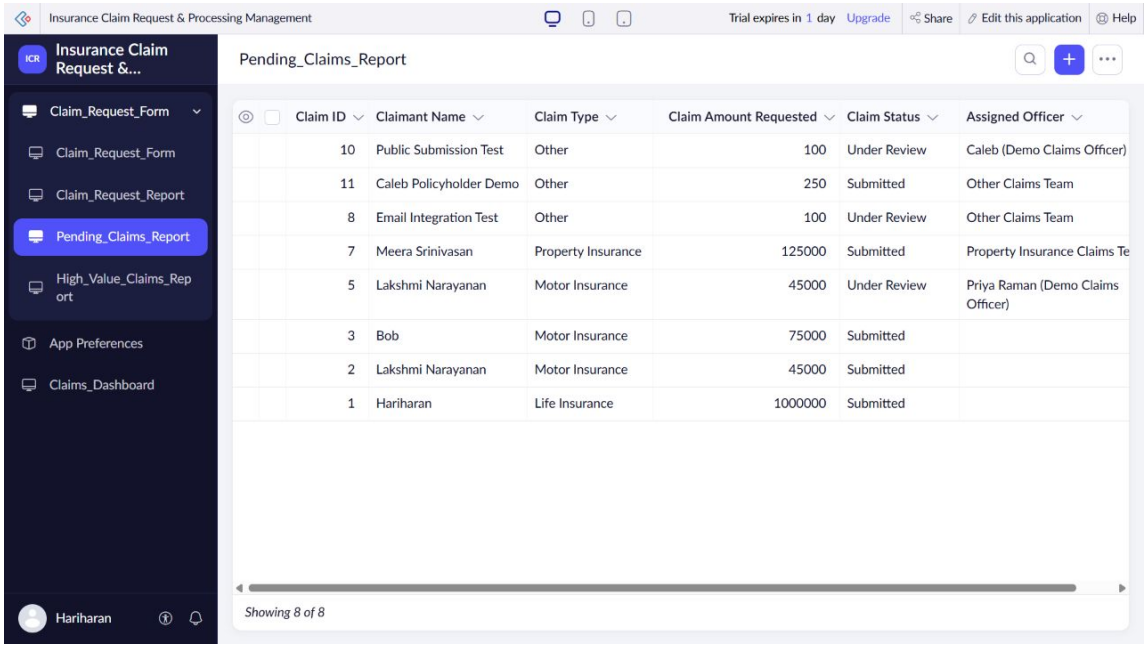

Figure 9.3 - Pending report displaying eight matching records.

Result

AI-assisted exploration and application-level analytics were demonstrated and verified. A separate native Zoho Analytics pivot component was not completed and is not claimed as an output.
