EXPERIMENT - 4

Data Modelling and Form Design for a Business Application in Zoho Creator

Insurance Claim Request & Processing Management

Application Name	Insurance Claim Request & Processing Management
Form Name	Claim_Request_Form
Experiment Focus	13 Basic Fields, sections and validation
Student Name	HARIHARAN N
Student Register No.	241401024
Experiment	4
Platform	Zoho Creator
Course	Low-Code Application Development using Zoho Creator

Lab Record
A structured insurance-claim application that captures claimant, contact, incident and declaration details using all thirteen Basic Fields. Real builder, form, validation and submitted-record screenshots document the implementation.

Department of Computer Science and Business Systems

Rajalakshmi Engineering College

1. Objective

To design Claim_Request_Form using all thirteen Basic Fields specified in the insurance project, organize the form into four sections, and validate information before storing a structured claim record.

2. Problem Statement

Paper-based insurance requests can contain missing policy details, unreadable contact information, invalid claim amounts and inconsistent incident dates. The branch needs a single form that produces complete, searchable claim records and supports subsequent assignment and processing.

3. Scope of the Use Case

Item	Implemented scope
Core entity	Insurance claim request
Primary users	Policyholder / Nominee / Third Party; claims staff; administrator
Form	Claim_Request_Form
Report	Claim_Request_Report
Submission channels	Authenticated application form and published public form
Record contents	Identity, policy, contact, incident, requested amount, document availability and declaration

4. Business Data Model

One submission creates one Claim_Request_Form record. The thirteen Basic Fields describe the business request. Claim_ID is an additional Auto Number reference; Claim_Status, Assigned_Officer, Investigation_Notes and Approval_Amount support staff processing in later experiments. No subform or lookup relationship is required for this single-entity project.

5. Basic Field Mapping - All 13 Fields

#	Basic Field	Exact Field Link Name	Purpose
1	Name	Claimant_Name	First and last name
2	Email	Email_Address	Acknowledgement and status contact
3	Address	Residential_Address	Residential address components
4	Phone	Contact_Number	Indian mobile contact
5	Single Line	Policy_Number	Insurance policy reference
6	Multi Line	Incident_Description	Incident circumstances
7	Number	Claim_Amount_Requested	Positive requested amount
8	Date	Date_Of_Incident	Incident date, not in the future
9	Time	Preferred_Callback_Time	Preferred callback time
10	Drop Down	Claim_Type	One insurance category
11	Radio	Claimant_Type	Policyholder / Nominee / Third Party
12	Multi Select	Supporting_Documents_Available	Documents the claimant can furnish
13	Checkbox	Declaration_Of_Authenticity	Mandatory truth-and-accuracy declaration

6. Section-wise Form Design

Section	Included fields
A - Claimant Details	Claimant_Name; Claimant_Type; Policy_Number
B - Contact Details	Email_Address; Contact_Number; Residential_Address
C - Claim Details	Claim_Type; Date_Of_Incident; Claim_Amount_Requested; Supporting_Documents_Available; Incident_Description
D - Scheduling & Declaration	Preferred_Callback_Time; Declaration_Of_Authenticity

7. Validation Rules

Field / rule	Configuration and observed behaviour
Claimant_Name	Mandatory. Both first and last names must remain non-blank after trimming.
Contact_Number	Mandatory. +91 followed by 10 digits; first national digit 6, 7, 8 or 9.
Policy_Number; Claim_Type; Claimant_Type	Mandatory. Claim type uses a drop-down; claimant type is a single radio selection.
Date_Of_Incident	Mandatory. Values later than zoho.currentdate are rejected.
Claim_Amount_Requested	Mandatory. Zero and negative values are rejected.
Email_Address	Optional; built-in format validation applies when supplied.
Declaration_Of_Authenticity	Mandatory checkbox: submission blocked until selected.

8. Implementation Procedure and Workflow

1. Create the insurance application and Claim_Request_Form in Zoho Creator.
2. Add each Basic Field with its exact link name; group fields into the four required sections.
3. Configure mandatory fields, name components, radio/drop-down choices and Indian phone format.
4. Use the validation workflow to enforce positive amount, non-future date and mandatory declaration.
5. Preview the form, submit synthetic records and inspect the resulting Claim_Request_Report.
6. Use Claim_ID as the reference. Staff-only processing fields are hidden when opening a new form.

9. Sample Business Records

The following synthetic records were actually created and reviewed in Zoho Creator. They are demonstration data, not real claims or decisions.

Ref. / claimant	Policy / category	Requested INR	Observed status
5 - Lakshmi Narayanan	DEMO-MOTOR-2026-001 / Motor Insurance	45,000	Under Review
6 - Arun Kumar	DEMO-HEALTH-2026-002 / Health Insurance	85,000	Approved; approval 80,000
7 - Meera Srinivasan	DEMO-PROPERTY-2026-003 / Property Insurance	125,000	Submitted
9 - Kavya Raman	DEMO-TRAVEL-2026-009 / Travel Insurance	25,000	Approved; approval 20,000
11 - Caleb Policyholder Demo	DEMO-RBAC-2026-011 / Other	250	Submitted

Field choices: Claim_Type includes Motor, Health, Life, Property and Travel Insurance, plus Other. Supporting_Documents_Available includes Photographs, Police FIR Copy, Repair Estimate, Medical Documents, Policy Copy and Other.

Declaration: I declare that the information provided is true and accurate.

10. Implementation Evidence

The next pages contain actual screenshots captured from the application. Validation screenshots were captured during the execution tests; current reports contain 11 records. Earlier screens retain the record count present when the test was performed.

10. Implementation Evidence - Form Builder

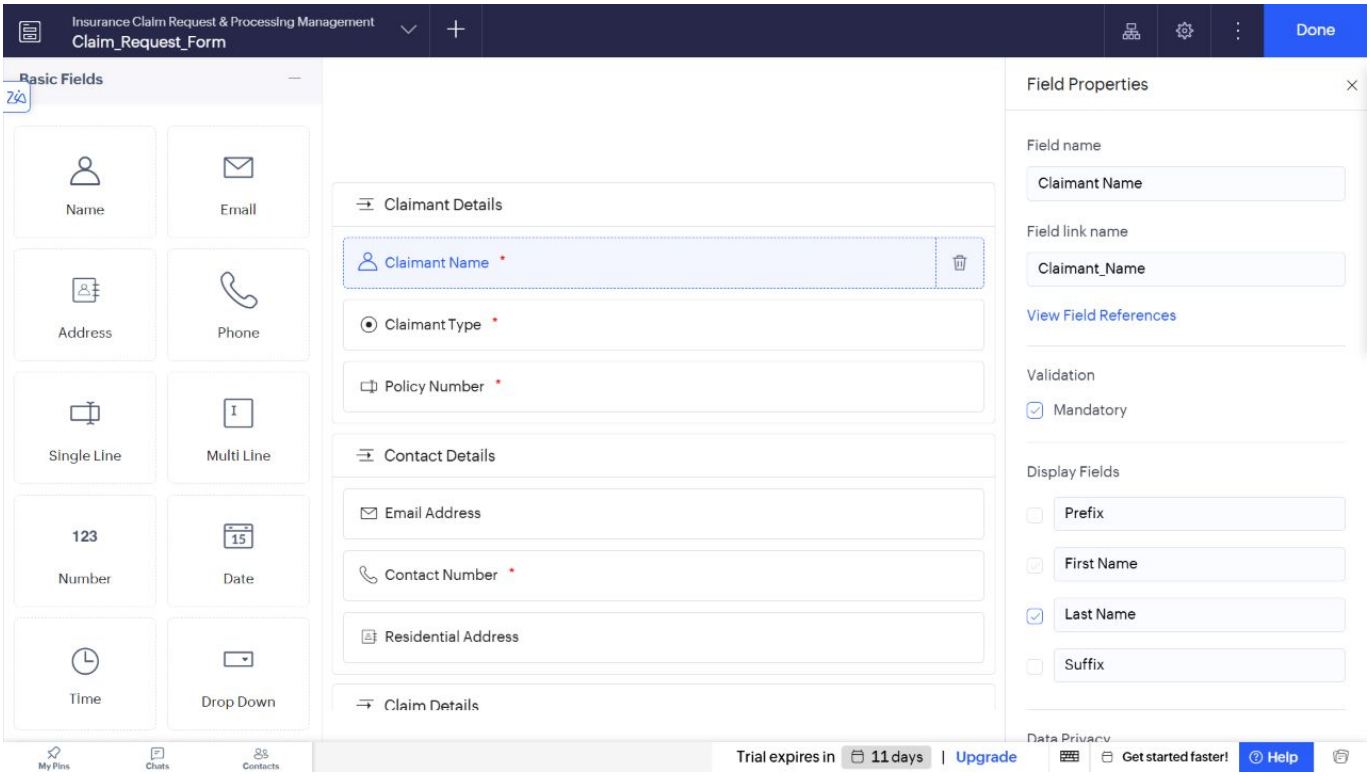

Figure 1. Actual Zoho Creator Form Builder with the Basic Fields palette, mandatory claimant-name field and field properties.

10. Implementation Evidence - Form Preview

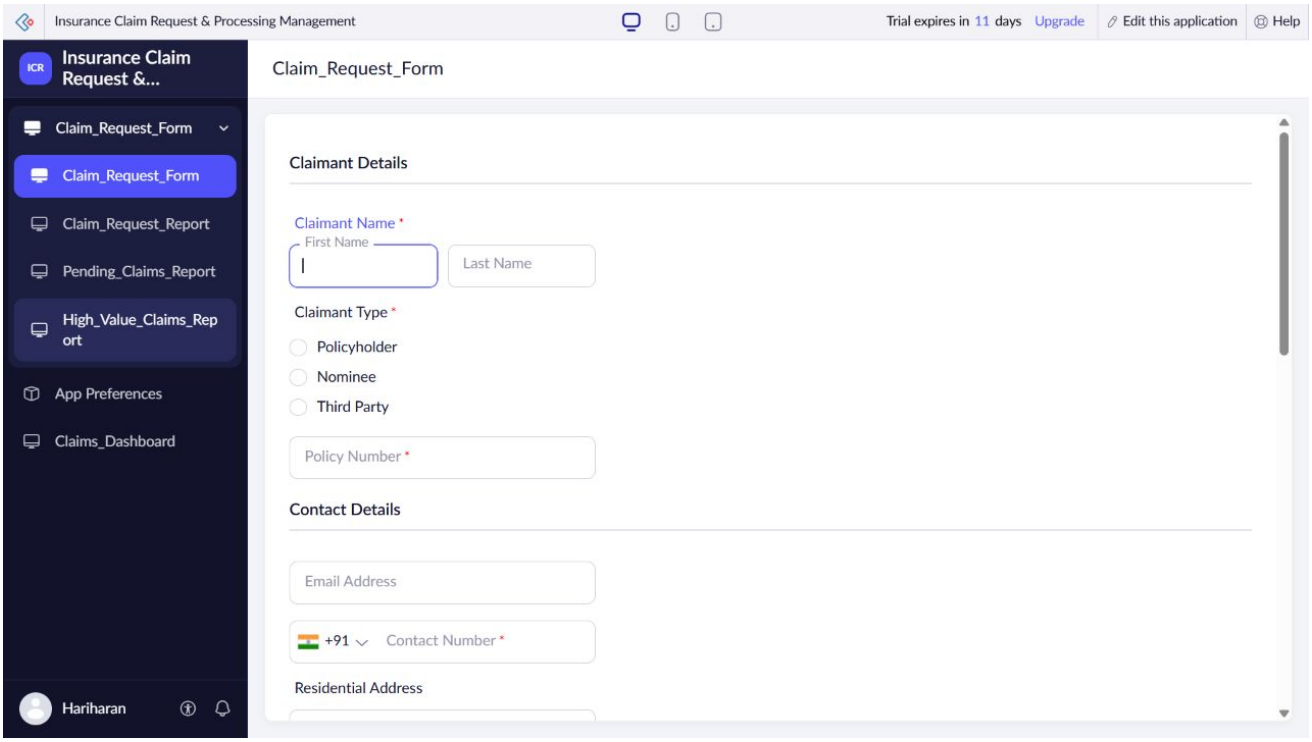

Figure 2. Live form: Claimant Details and upper Contact Details.

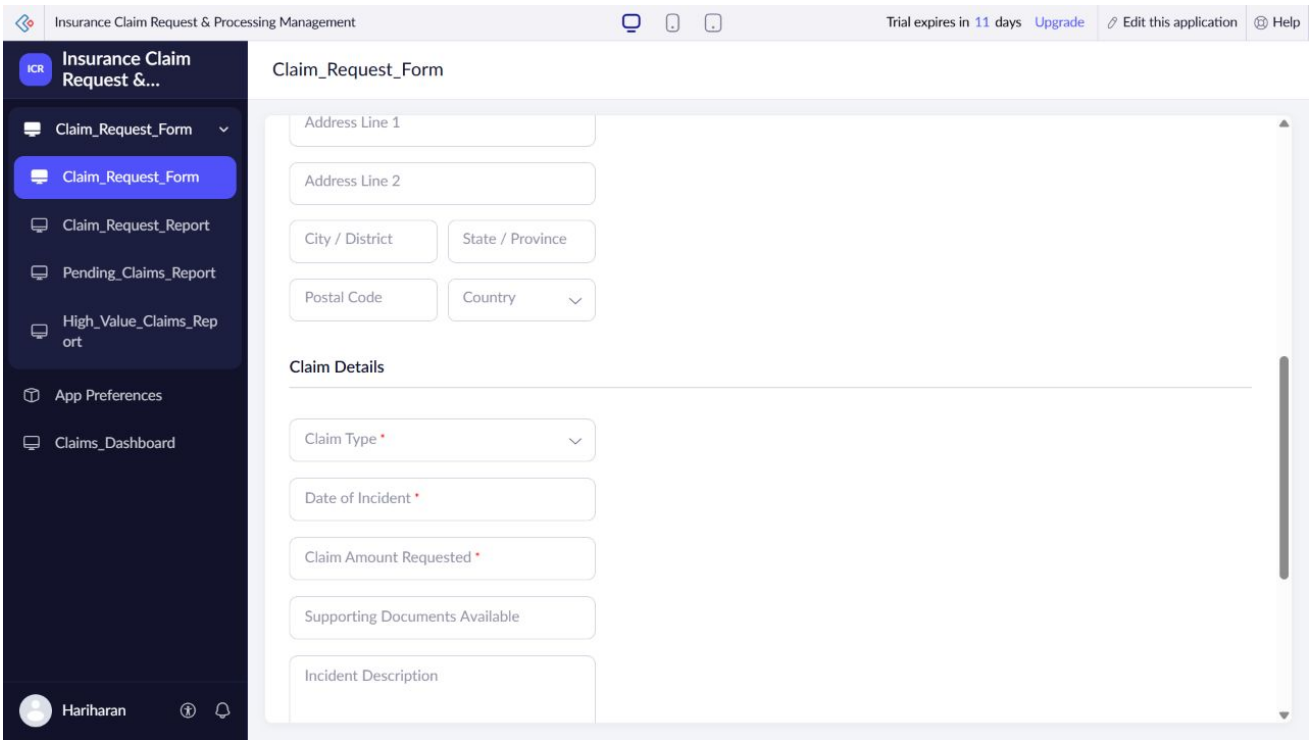

Figure 3. Live form: address components and Claim Details.

10. Implementation Evidence - Declaration

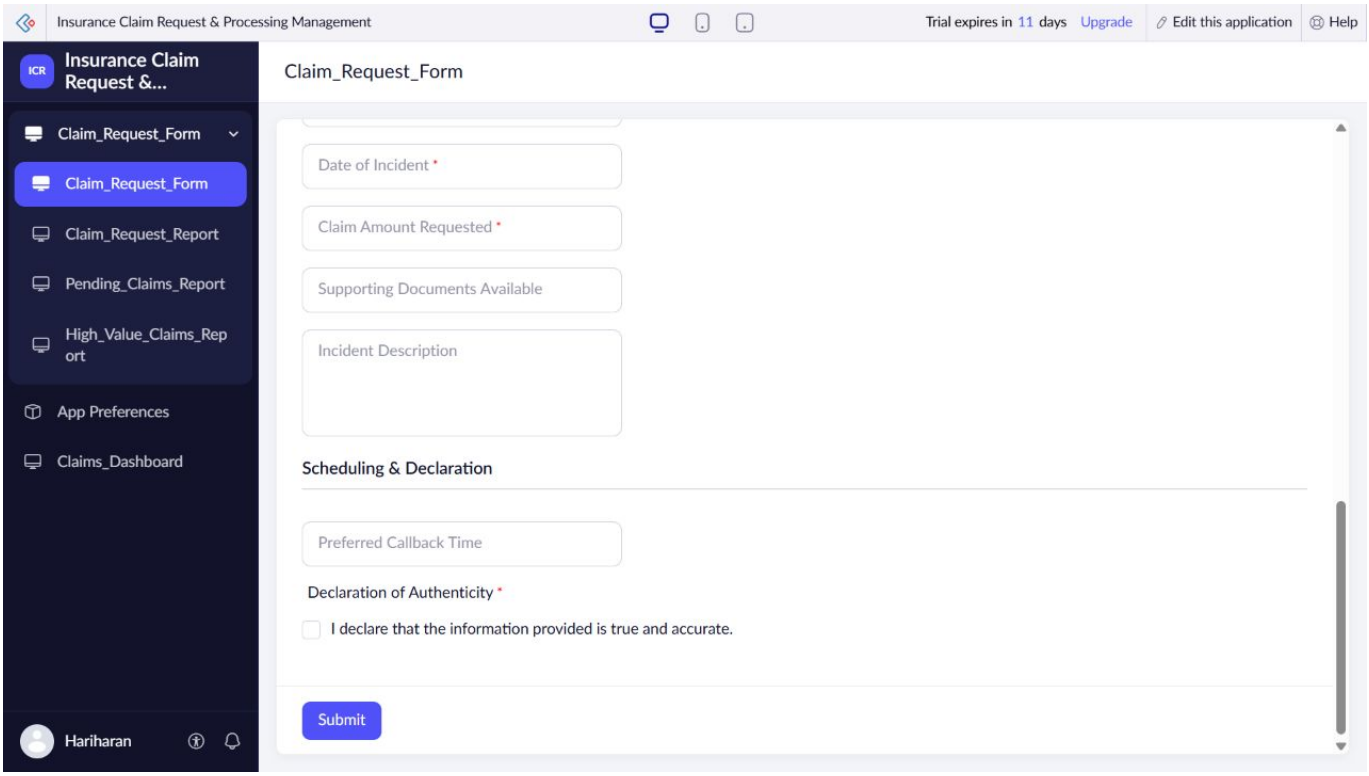

Figure 4. Live form: incident information, callback time, mandatory declaration and Submit button.

10. Implementation Evidence - Mandatory Fields

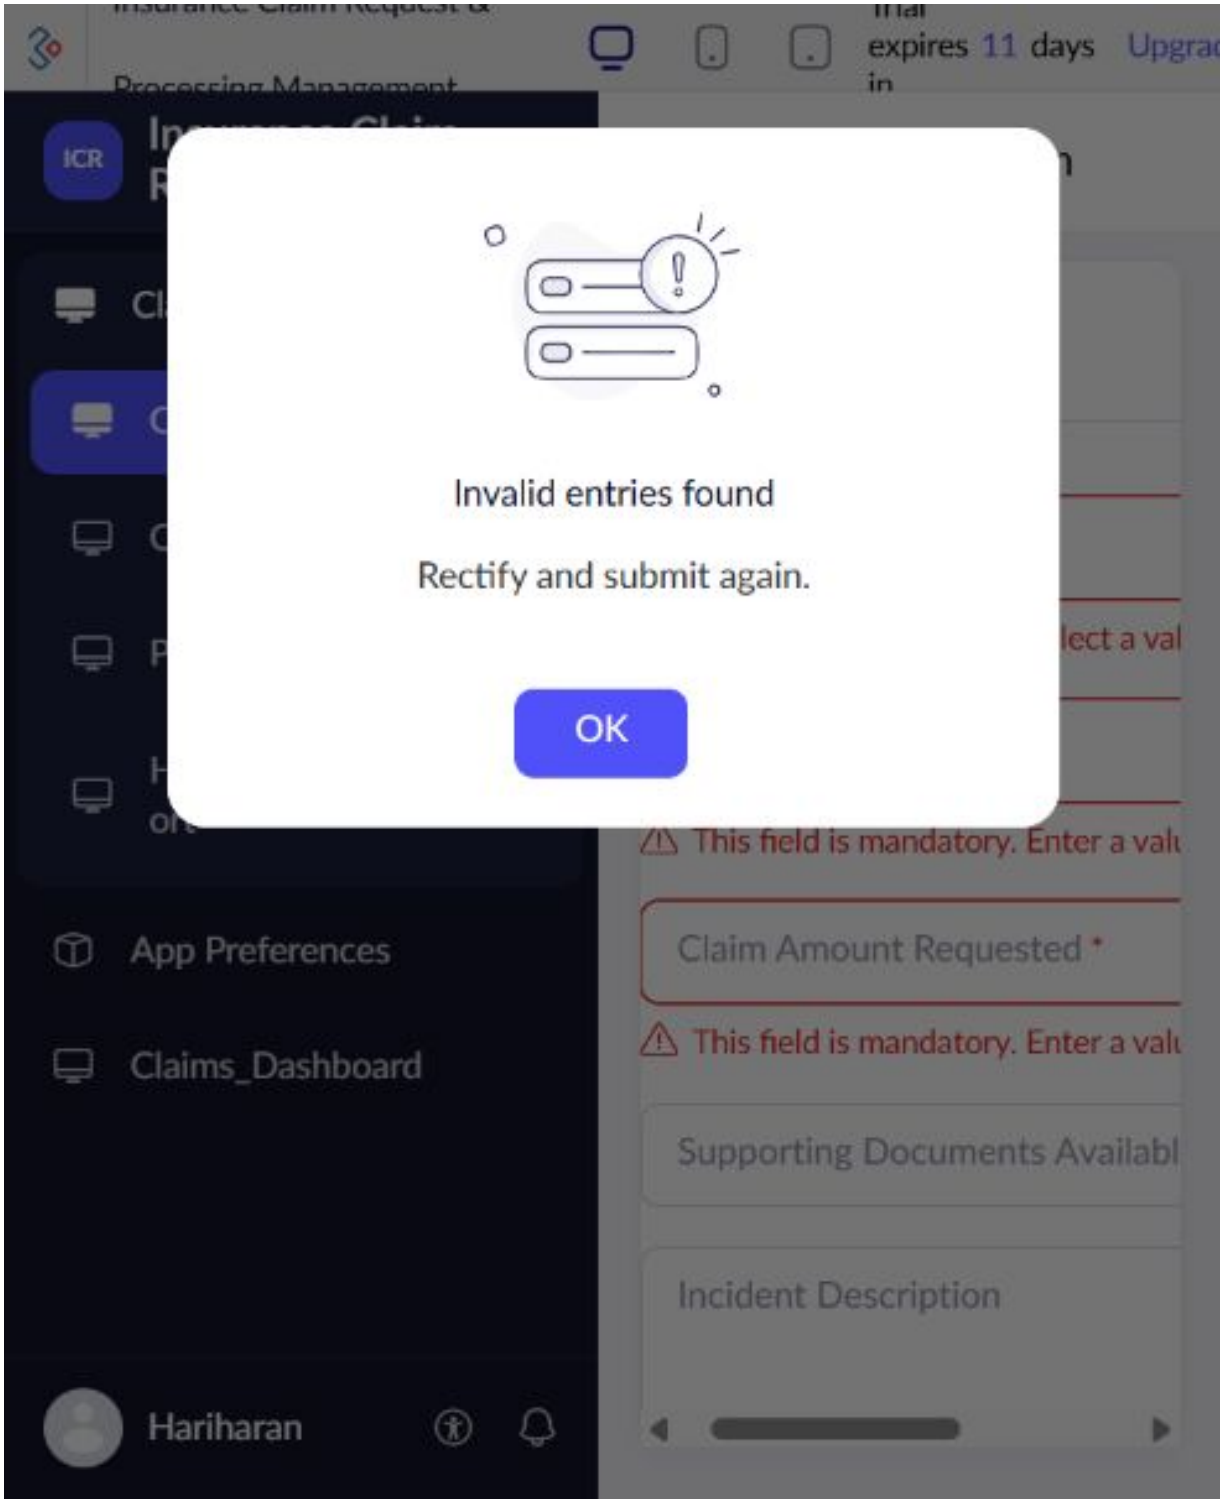

Figure 5. Required-field submission rejected before a claim could be saved.

10. Implementation Evidence - Validation

Actual validation alerts from the test run; no record was created for the rejected values.

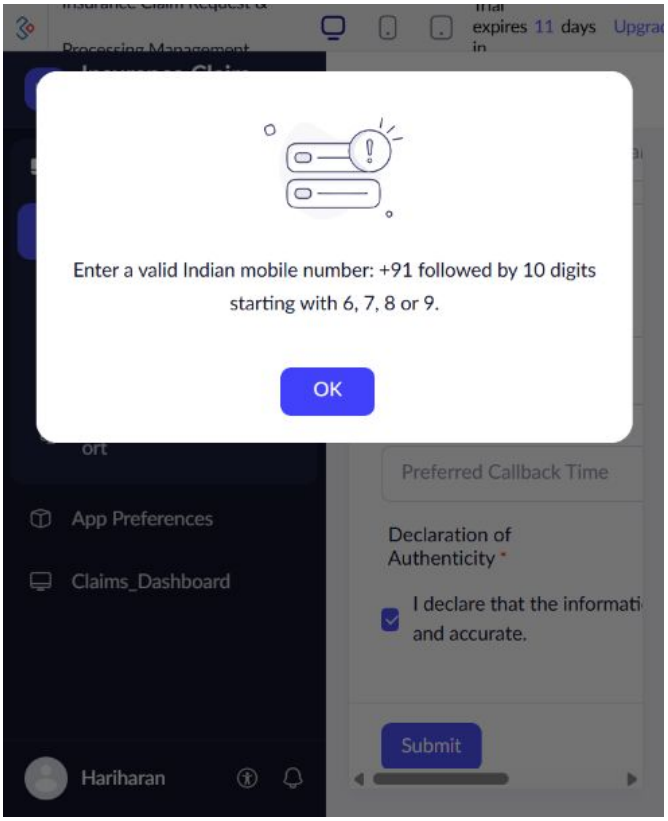

Figure 6. Invalid Indian mobile number rejected.

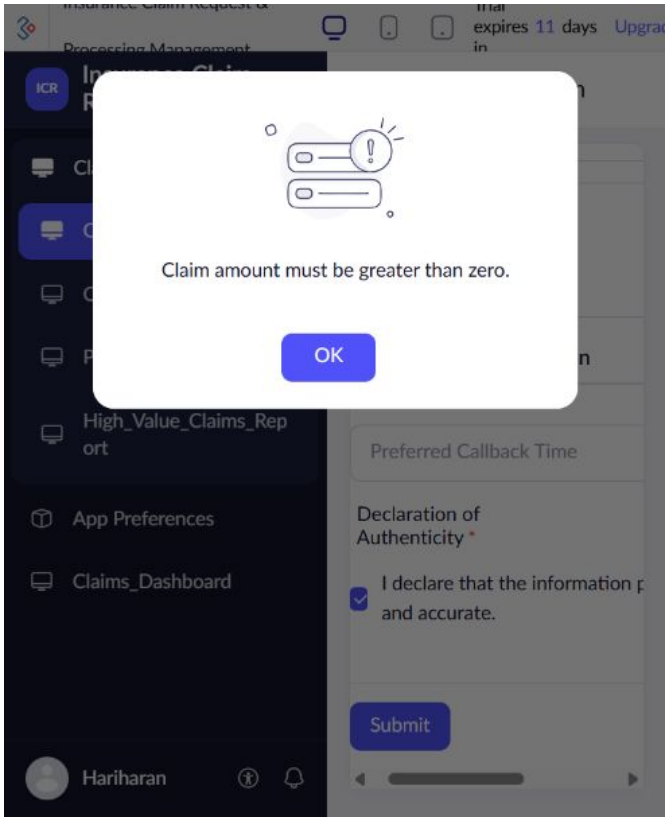

Figure 7. Zero claim amount rejected.

10. Implementation Evidence - Date and Email

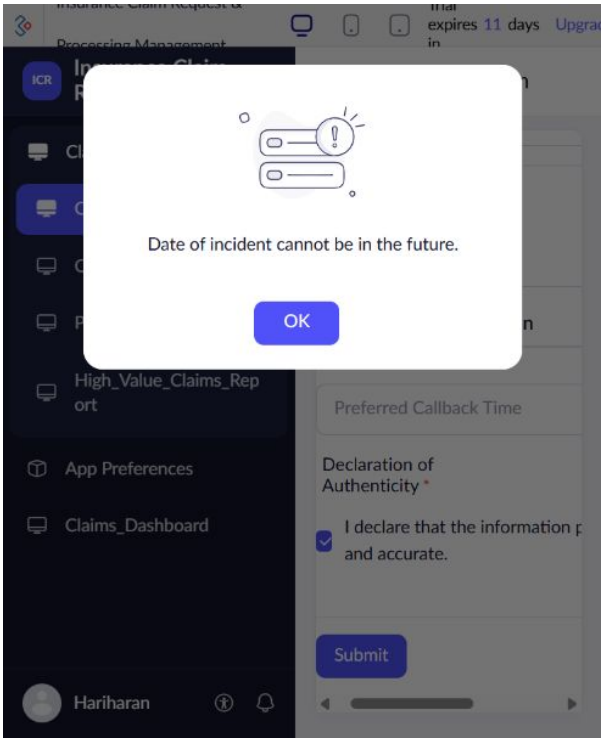

Figure 8. Future incident date rejected.

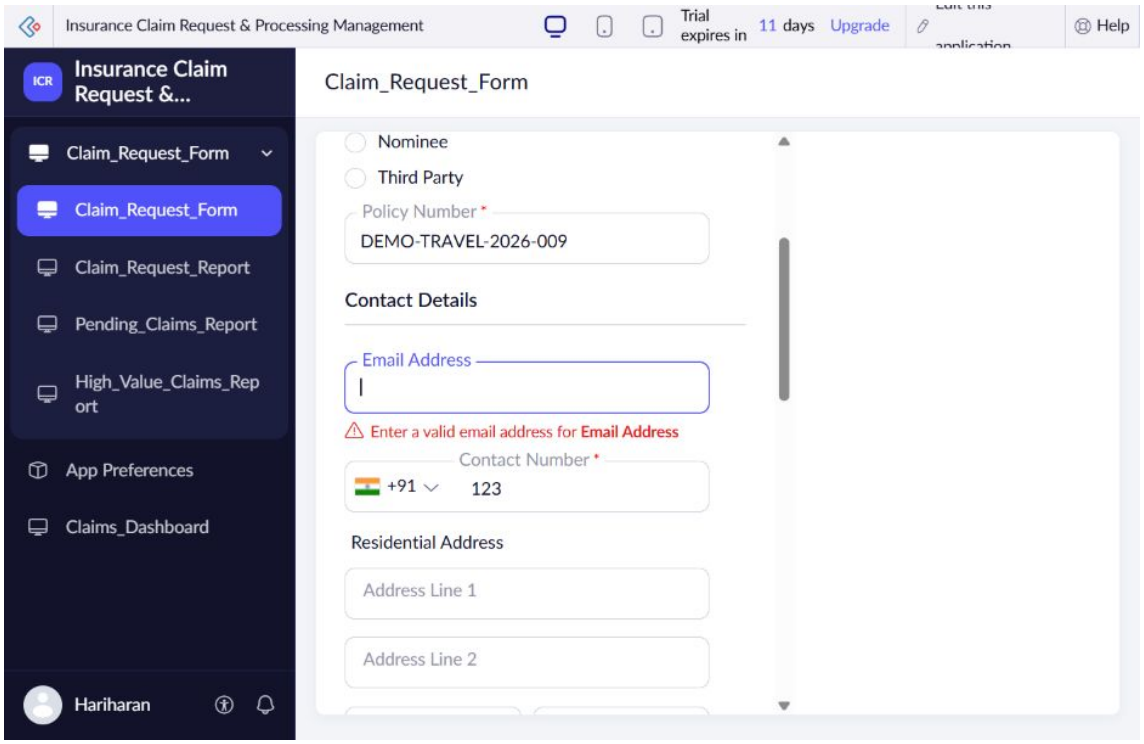

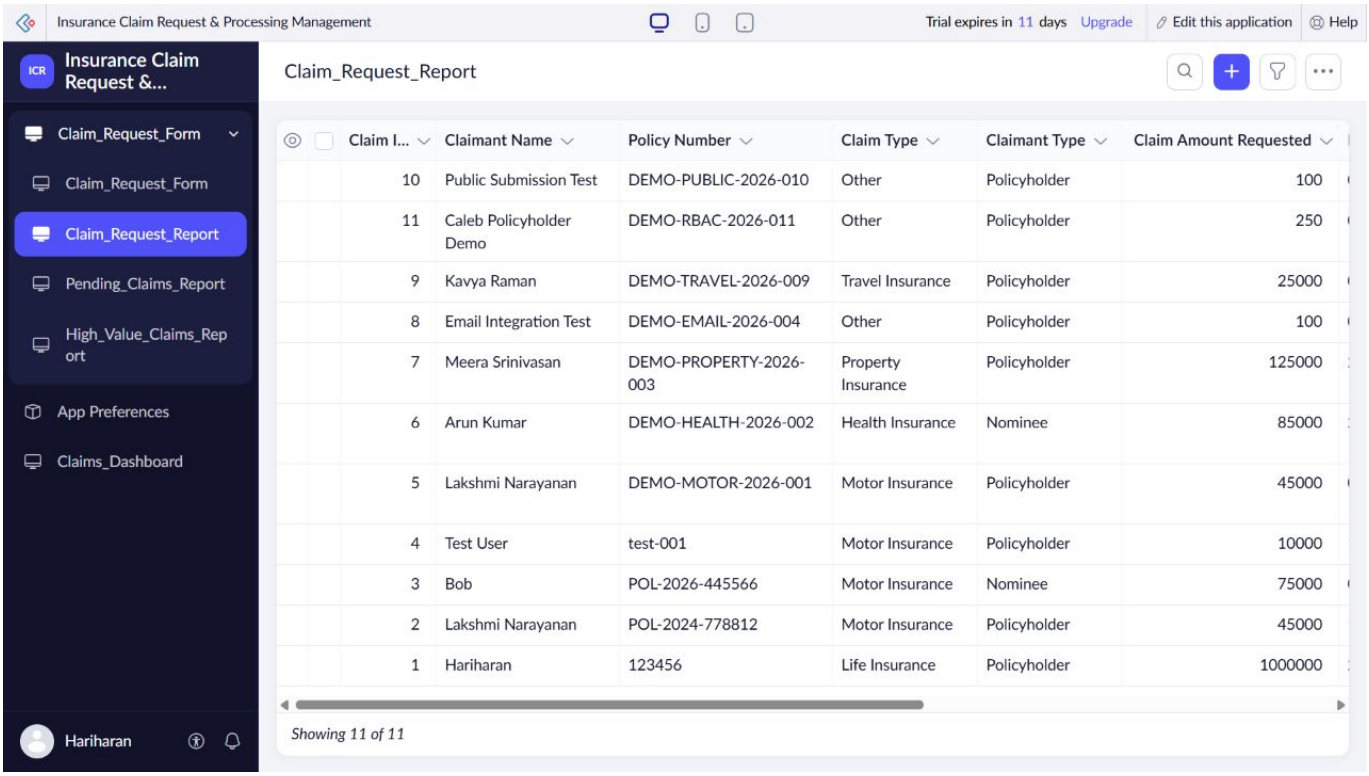

Figure 9. Invalid email format rejected by the Email field.

10. Implementation Evidence - Saved Records

Claim I...	Claimant Name	Policy Number	Claim Type	Claimant Type	Claim Amount Requested
10	Public Submission Test	DEMO-PUBLIC-2026-010	Other	Policyholder	100
11	Caleb Policyholder Demo	DEMO-RBAC-2026-011	Other	Policyholder	250
9	Kavya Raman	DEMO-TRAVEL-2026-009	Travel Insurance	Policyholder	25000
8	Email Integration Test	DEMO-EMAIL-2026-004	Other	Policyholder	100
7	Meera Srinivasan	DEMO-PROPERTY-2026-003	Property Insurance	Policyholder	125000
6	Arun Kumar	DEMO-HEALTH-2026-002	Health Insurance	Nominee	85000
5	Lakshmi Narayanan	DEMO-MOTOR-2026-001	Motor Insurance	Policyholder	45000
4	Test User	test-001	Motor Insurance	Policyholder	10000
3	Bob	POL-2026-445566	Motor Insurance	Nominee	75000
2	Lakshmi Narayanan	POL-2024-778812	Motor Insurance	Policyholder	45000
1	Hariharan	123456	Life Insurance	Policyholder	1000000

Figure 10. Claim_Request_Report showing 11 records, including the three required synthetic Motor, Health and Property claims.

11. Expected Learning Outcomes

1. Map business attributes to all thirteen Basic Fields.

2. Organize a form into meaningful sections and distinguish required from optional data.

3. Validate formats, dates, numbers and declarations before persistence.

4. Explain how one form submission becomes a report record.

12. Result

The insurance claim data model and form were implemented with all thirteen required Basic Fields, four submission sections and the specified validations. At least three realistic synthetic test records were saved and verified.

Conclusion

The application converts an unstructured claim enquiry into a validated digital record suitable for reporting, assignment and controlled processing.

Observed scope: Document availability is captured through a Multi Select field; this project does not include document-file upload. Authenticated submission is used for own-record status tracking.
