EXPERIMENT 15

Report and presentation on career pathways and the future of low-code development.

Student details	Project details
HARIHARAN N Register No. 241401024	Insurance Claim Request & Processing Management
Department: CSBS	Platform: Zoho Creator (India region)
Institution: Rajalakshmi Engineering College	Evidence / verification date: 19 October 2026

Aim

To prepare a report and presentation connecting the insurance project with low-code career pathways, emerging directions and a practical learning plan.

Execution status

Career and future-scope report completed. A five-slide presentation is included in the following pages, ready for classroom discussion. It does not claim employment outcomes or completed certifications.

Application context

The project records insurance requests, validates submitted details, assigns claims for processing and presents claim status and amount summaries. Existing forms, reports, Deluge workflows and permission profiles provide the base for this experiment.

Screenshots in this report are actual captures from the project account. Explanations, tables and code listings are documentation, not simulated platform screenshots.

Career pathways and project portfolio

Pathway	Skills demonstrated and next learning step
Low-code application developer	Forms, reports and Deluge; deepen data modelling, reusable functions and regression testing.
Business / process analyst	Translate submission and processing needs into fields and statuses; learn requirement traceability and process measurement.
Integration developer	Connections and API contracts; extend authentication, idempotency, retries and asynchronous processing.
QA / application support	Validation cases, environment separation and evidence capture; build repeatable release checks and monitoring.
Platform administrator	Roles, permission profiles and governance; develop access-review, backup and recovery practices.
Solution architect	Choose boundaries between Creator and custom services; evaluate scale, cost, portability and operational ownership.

Portfolio evidence

Use the insurance application, verified screenshots, Deluge source, test results and deployment evidence as a coherent portfolio. Explain what was implemented and what remains pending. A small reproducible test is stronger evidence than an unsupported claim of enterprise readiness.

Learning plan

Weeks 1-2: strengthen data modelling and field validation. **Weeks 3-4:** test Deluge and APIs. **Weeks 5-6:** practise role-based tests and staged releases. **Weeks 7-8:** add monitoring, benchmark realistic loads and present design trade-offs. Certification can complement a portfolio after checking the current official pathway requirements.

Future scope: an evidence-based roadmap

Direction	Insurance-project opportunity and condition
AI-assisted development	Use AI for suggestions and draft logic; validate against real schemas, permissions and tests.
Hybrid low-code / pro-code	Use specialized functions for measured gaps. Catalyst remains pending in this project.
Governed self-service	Enable business teams to build within approved schemas, roles and release processes.
Observability and quality	Track workflow failures, query latency and API outcomes using minimized, access-controlled logs.
Interoperability	Define versioned APIs and exportable data contracts to reduce integration coupling.
Human oversight	Keep consequential claim outcomes accountable to authorized people and documented business rules.

Result

The report connects practical project work with multiple career paths and proposes a staged learning and improvement plan. Future directions are opportunities and recommendations, not guaranteed market predictions.

Presentation guide

The next five pages form a concise presentation: project context, skills, demonstrated evidence, future roadmap and conclusion. Suggested delivery time is 5-7 minutes. Screenshots are reused only where they substantiate the presentation.

Presentation 1 / 5 - From problem to application

INSURANCE CLAIMS AS A LOW-CODE CASE STUDY

Business need: consistent claim submission, controlled processing and visible status information.

Application layer	Project example
Capture	Claim_Request_Form and validation
Process	Deluge workflows, assignment and notifications
Observe	Reports and Claims_Dashboard
Control	Permission profiles and environment releases

Speaker note

Explain the end-to-end process before naming tools. Describe the difference between submitting a request and making a claim decision.

Presentation 2 / 5 - Skills and career choices

ONE PROJECT, MULTIPLE CAREER PATHS

1. Developer: translate rules into reliable forms, queries and functions.

2. Analyst: clarify workflows and define useful measures.

3. Integration engineer: connect systems with safe contracts and recovery behavior.

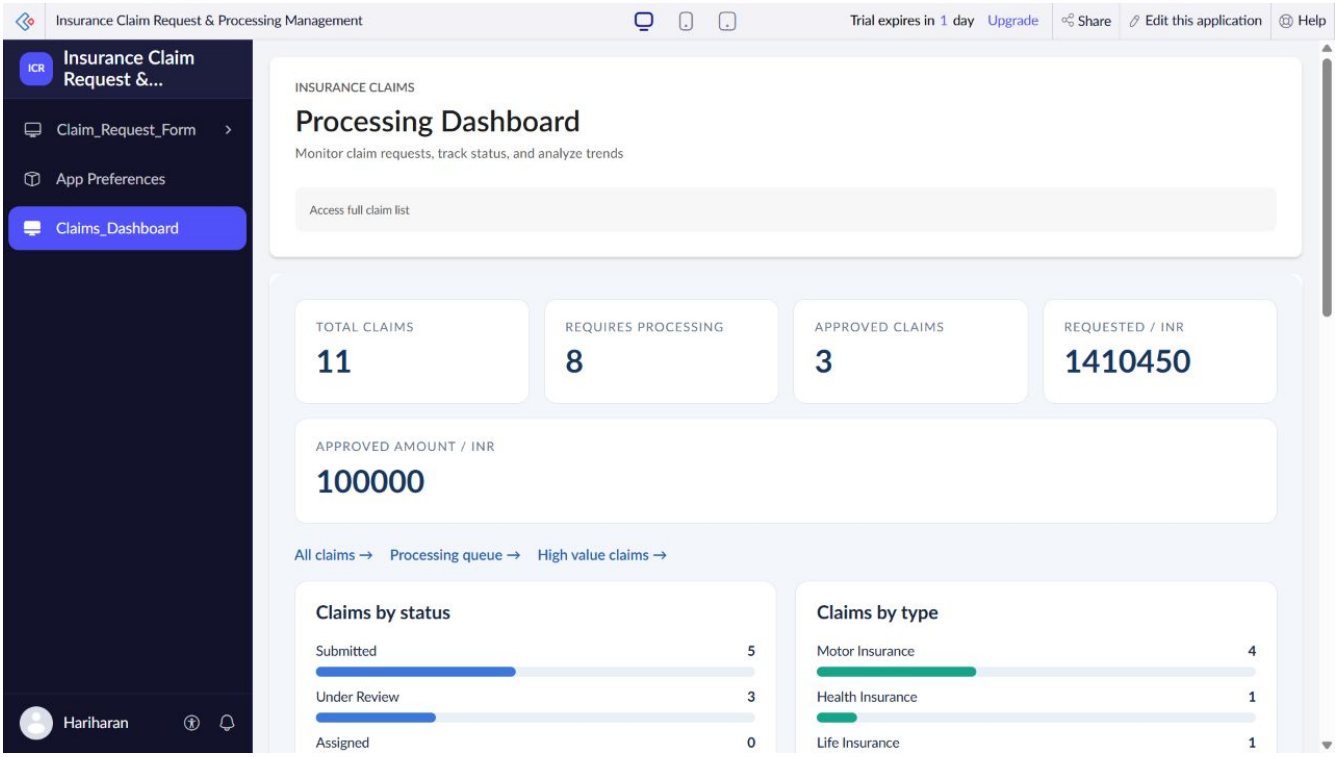

4. QA / administrator: verify access, test releases and maintain service quality.

5. Architect: decide where native platform features end and custom services begin.

Speaker note

Select one pathway and explain which project artifact demonstrates a relevant skill. Discuss a specific next learning step.

Presentation 3 / 5 - Evidence over claims

Actual production dashboard used as project evidence.

Demonstrated: live summaries, read-only query comparison, three Development test records and documented permissions. Limits: no enterprise load benchmark; Catalyst remains pending.

Speaker note

Explain why correct aggregates and real screenshots are useful, but insufficient to claim large-scale performance or complete security assurance.

Presentation 4 / 5 - Future development roadmap

BUILD CAPABILITY IN MEASURABLE STEPS

Next step	Evidence of success
Repeatable role tests	Denied cross-user record access
Representative load test	Recorded latency under a stated workload
Invoice / history model	Validated repeating data and complete event history
Authenticated custom service	Verified cloud response and controlled error handling
Operational review	Recovery exercise and documented access review

Speaker note

Frame AI and pro-code as tools for specific needs. Avoid promising that a platform feature alone solves governance, scale or reliability.

Presentation 5 / 5 - Conclusion and discussion

DELIVERY SPEED + ENGINEERING DISCIPLINE

Low-code can accelerate application delivery. Sustainable work still requires sound data design, validation, testing, security and clear operational ownership.

1. Show a working feature and its test evidence.

2. State limitations and pending work honestly.

3. Choose a career pathway and keep improving a verifiable portfolio.

Discussion

Which project requirement is best handled natively in Creator? Which requirement would justify custom code? What evidence would be needed before using this classroom project for real enterprise operations?
