EXPERIMENT - 8

Configuring User Management and Role-Based Access Control (RBAC) in a Zoho Creator Application

Insurance Claim Request & Processing Management

Application Name	Insurance Claim Request & Processing Management
Form Name	Claim_Request_Form
Experiment Focus	Administrator, Claims Officer and Policyholder roles
Student Name	HARIHARAN N
Student Register No.	241401024
Experiment	8
Platform	Zoho Creator
Course	Low-Code Application Development using Zoho Creator

Lab Record
Roles, permissions, field visibility and actual separate-login tests demonstrate controlled claim access. Caleb was temporarily tested as Policyholder and then restored to Claims Officer.

Department of Computer Science and Business Systems

Rajalakshmi Engineering College

1. Objective

To configure access appropriate to administrators, claims staff and policyholders, and verify the restrictions using a separate authenticated user.

2. Access-Control Requirement

Claims staff must review and process the full queue. Policyholders must submit and track their own claims without viewing other claimants or changing processing outcomes. The administrator must retain full application control.

3. Role Hierarchy

Existing CEO role > Administrator > Claims Officer > Policyholder. Peer sharing is disabled and no additional data-sharing rules were added.

Role	Permission profile	Intended use
Administrator	Administrator_Full_Control	Full record permissions and reporting. Owner retains design/security administration.
Claims Officer	Claims_Officer_Processing	View and process all claims using operational reports/dashboard.
Policyholder	Policyholder_Submit_Own_Status	Add claims and view own claim status only.

4. Actual Account Assignment

Account	Final assignment
hariharan.n.2024.csbs@rajalakshmi.edu.in	Application owner / Super Admin
caleb.d.2024.csbs@rajalakshmi.edu.in	Claims Officer / Claims_Officer_Processing; invitation accepted.

For testing, Caleb was temporarily changed to Policyholder with the user's approval. After the tests, the original Claims Officer role and permission profile were restored and verified. There is no permanent Policyholder account in the final user list.

5. Permission Matrix

Capability	Administrator	Claims Officer	Policyholder
Submit a claim	Yes	Yes	Yes
Claim_Request_Report	View/Edit/Delete all	View/Edit all	View own only
Pending / High Value reports	View/Edit/Delete	View/Edit	No access
Dashboard	Yes	Yes	No menu access
Delete records	Yes	No	No
Import / Export	Yes	No	No
Create new report	Yes	No	No
View all / Modify all	Yes / Yes	Yes / Yes	No / No
API access	Enabled	Disabled	Disabled
Read / Write comments	Yes / Yes	Yes / Yes	No / No

6. Field-Level Restrictions

For Policyholder_Submit_Own_Status, Assigned_Officer and Investigation_Notes are hidden. Claim_ID, Claim_Status and Approval_Amount are read-only. The new-form workflow hides the entire Claim Processing section on submission.

The Claimant_Type radio choice describes the person making a claim; it does not assign a security role. Security roles and permission profiles are assigned by the administrator.

7. Configuration and Test Procedure

1. Create Administrator, Claims Officer and Policyholder beneath the existing role hierarchy.

2. Create the three named permission profiles and configure form/report/page access.

3. Apply field visibility, read-only settings and least-required operations for Policyholder.

4. Add Caleb as an application user with Claims Officer and Claims_Officer_Processing. Accept the invitation and sign in separately.

5. Test full-queue processing using only synthetic claim #10.

6. Temporarily change Caleb to Policyholder, sign in again and compare record visibility before and after submitting claim #11.

7. Test staff-report and administration links. Return to the owner account and restore Claims Officer permissions.

8. Claims Officer Runtime Tests

Test	Observed result
Account identity	Caleb college email verified in runtime profile.
Record access	All 10 records at that test stage visible.
Processing	Claim #10 moved to Under Review; Caleb (Demo Claims Officer) and demo notes saved.
Reports / dashboard	Available with the expected records and totals.
Delete / import / export	No controls exposed in the tested record/report menus.
Application administration	Direct builder URL returned Access denied.

9. Policyholder Runtime Tests

Test	Observed result
Before submission	No Data Available; Showing 0 of 0. Other users' 10 existing records were hidden.
Authenticated submission	Created claim #11, DEMO-RBAC-2026-011, requested INR 250, status Submitted.
After submission	Exactly 1 of 1 visible: Caleb's own claim #11.
Own record actions	No Edit, Delete or comments; Duplicate remains because submission is allowed.
Staff-only fields	Assigned Officer and Investigation Notes not shown.
Pending / High Value direct links	UI returned Report inaccessible. The captured images caught the loading overlay; the textual UI result was verified separately.
Administration direct link	Access denied; screenshot retained.
Dashboard	Hidden from menu. Direct link showed no data but an empty/loading view rather than an explicit denial.
Restoration	Claims Officer / Claims_Officer_Processing saved and verified.

The own-record check is based on the authenticated submitting user. Anonymous public submissions were not demonstrated to become owned by a later signed-in policyholder. Use authenticated submission for the tested own-status flow.

The tests establish the observed application permissions; destructive operations were not executed merely to test denial.

10. Implementation Evidence - Roles and Profiles

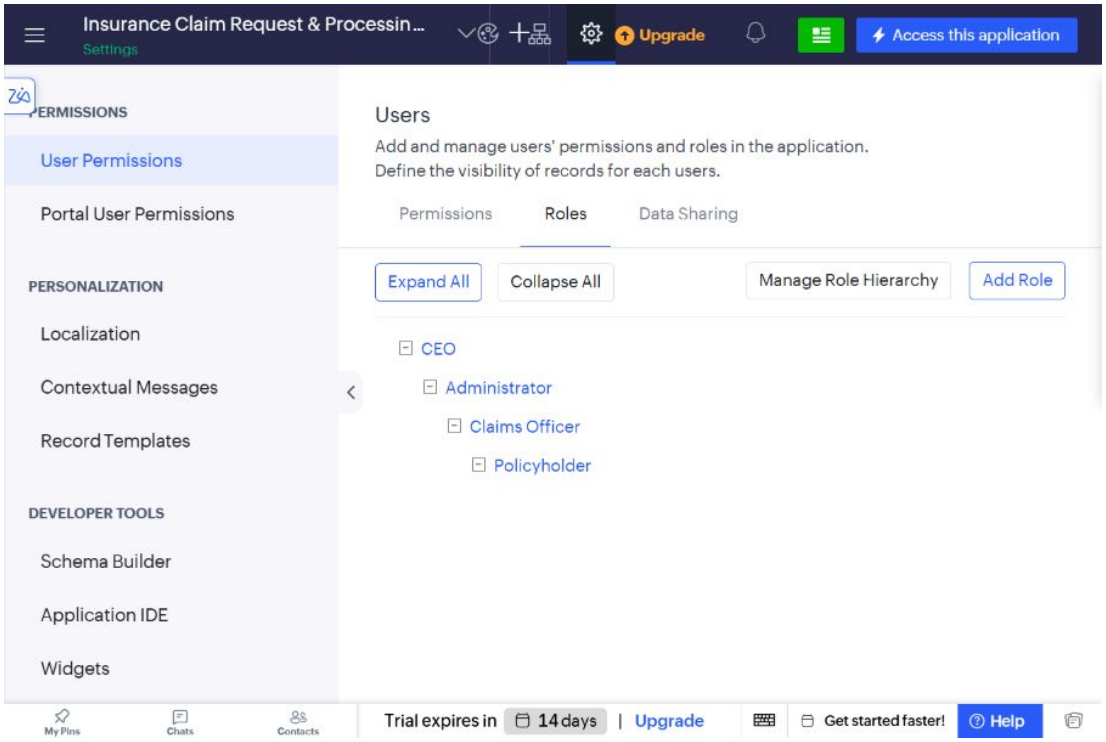

Figure 1. Role hierarchy: CEO, Administrator, Claims Officer and Policyholder.

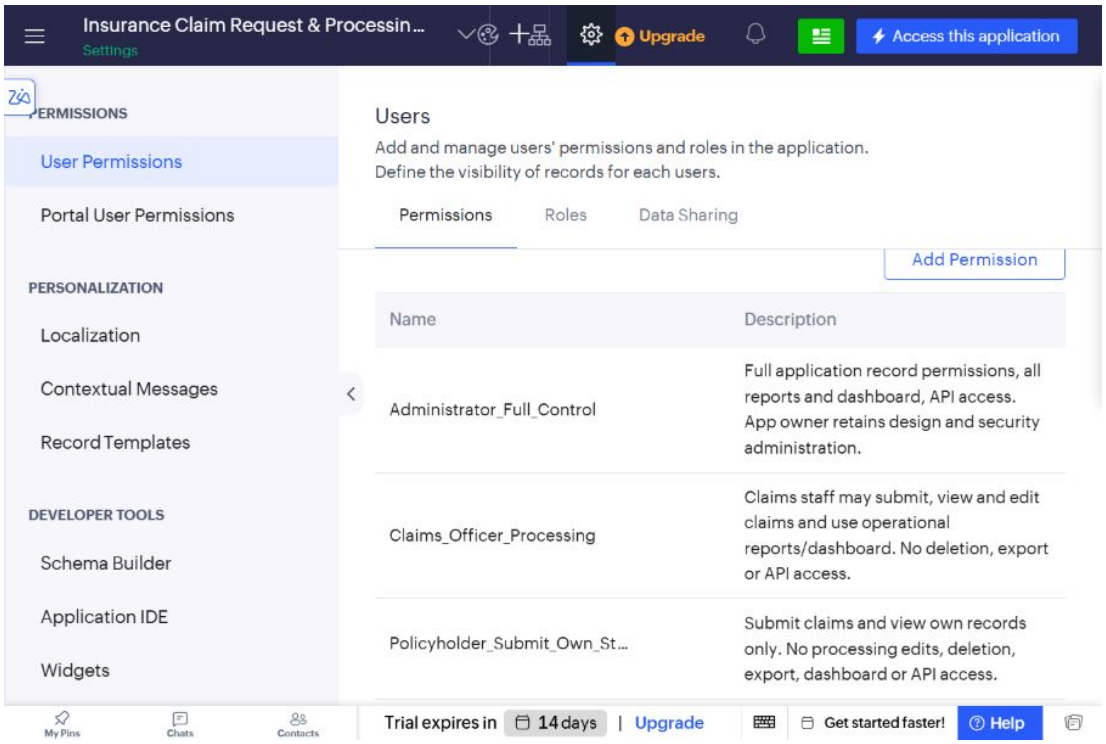

Figure 2. Named permission profiles configured in application settings.

10. Implementation Evidence - Staff Permissions

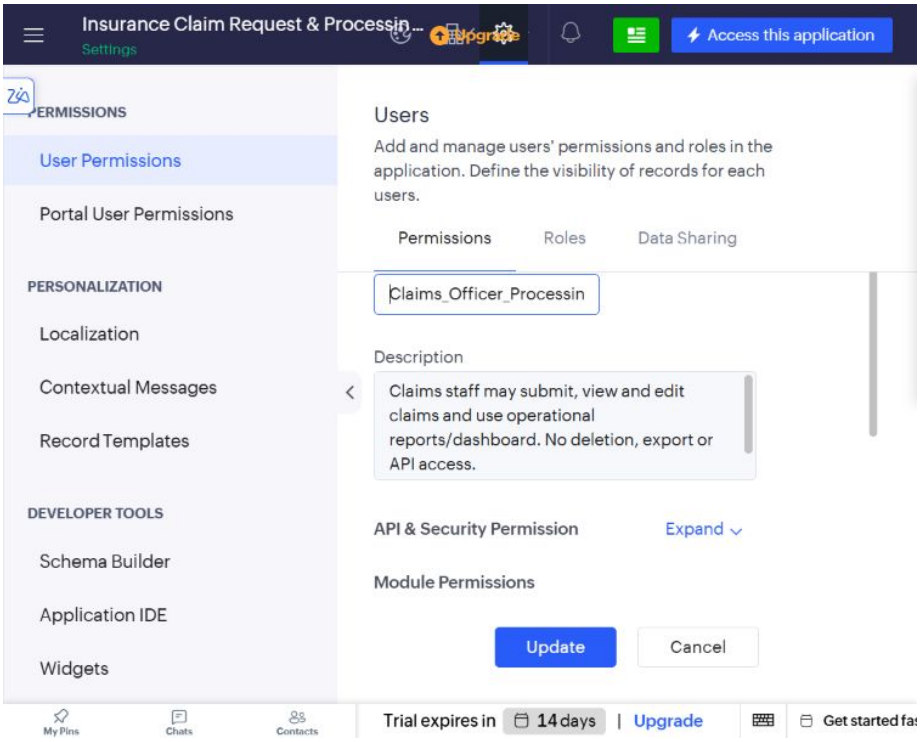

Figure 3. Claims Officer permission profile audit.

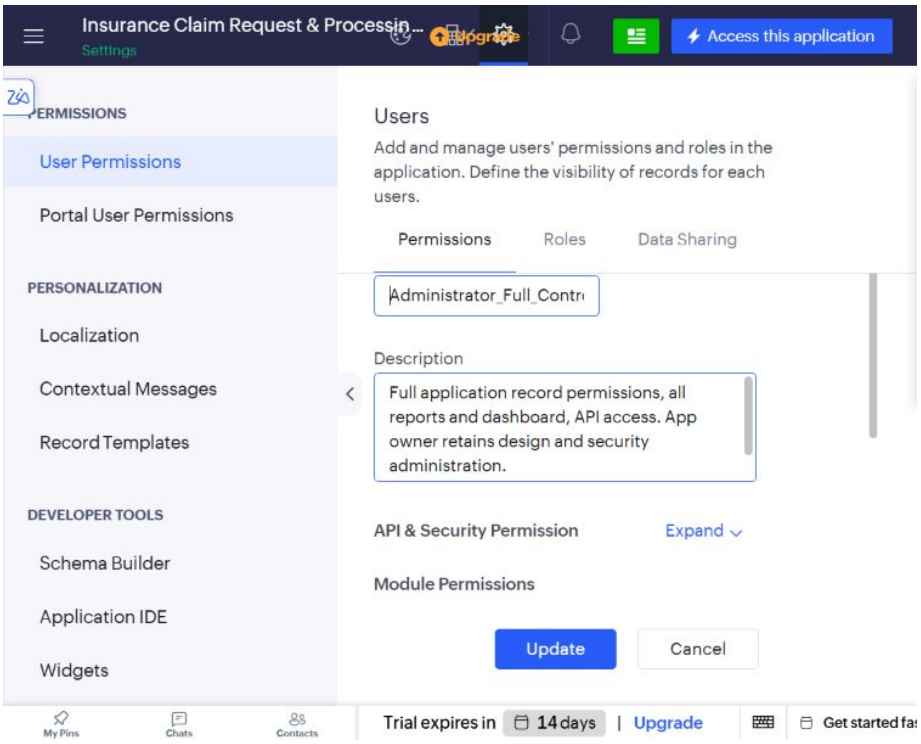

Figure 4. Administrator permission profile audit.

10. Implementation Evidence - Field Security

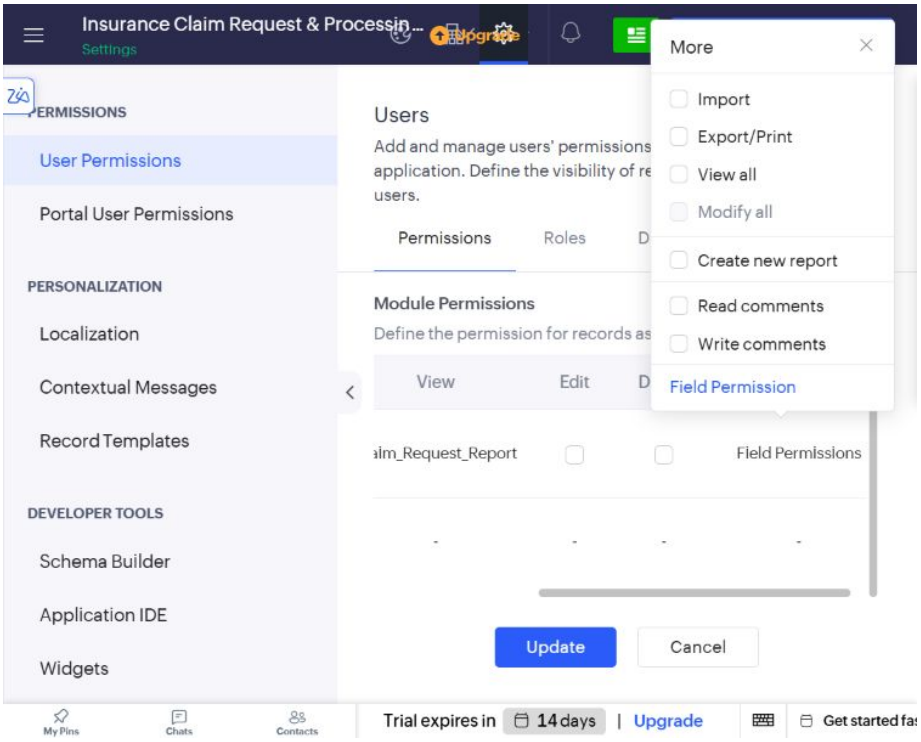

Figure 5. Policyholder report permissions: no View all / Modify all or export.

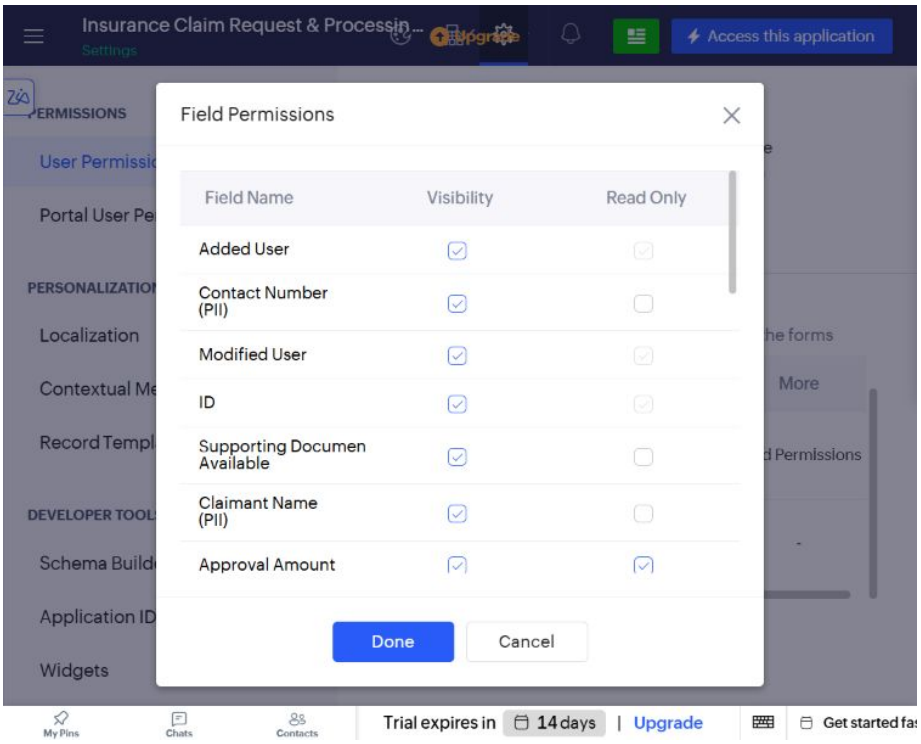

Figure 6. Policyholder field-level visibility/read-only configuration.

10. Implementation Evidence - Officer Session

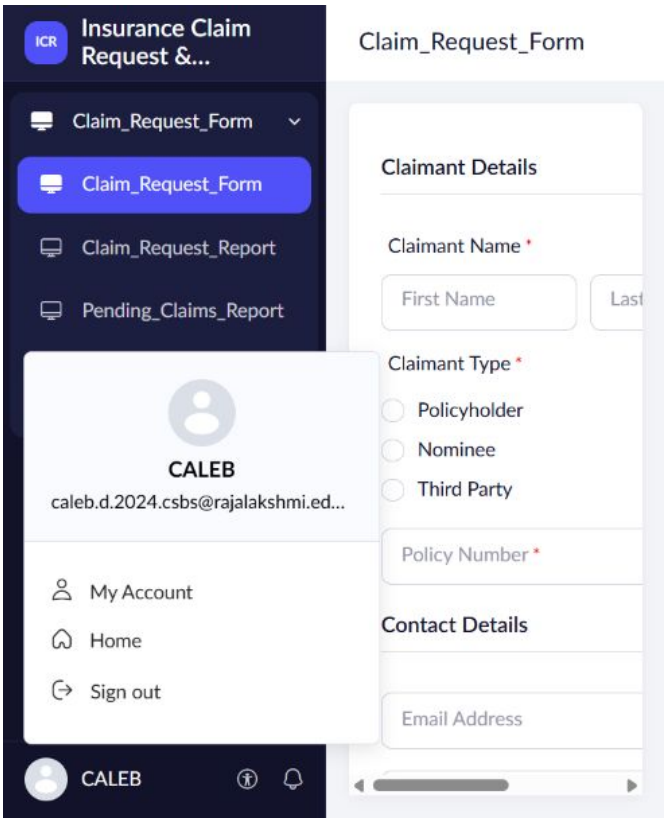

Figure 7. Caleb identity in the Claims Officer runtime session.

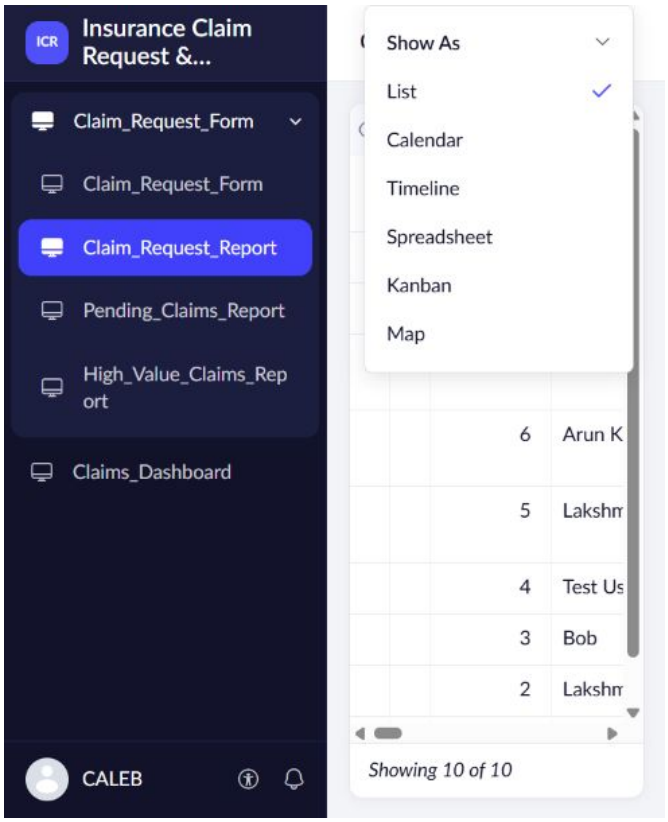

Figure 8. Officer report menu exposes Show as but no Import or Export.

10. Implementation Evidence - Isolated Records

These original runtime captures use the browser's narrow panel. Their record counters document the before/after isolation test.

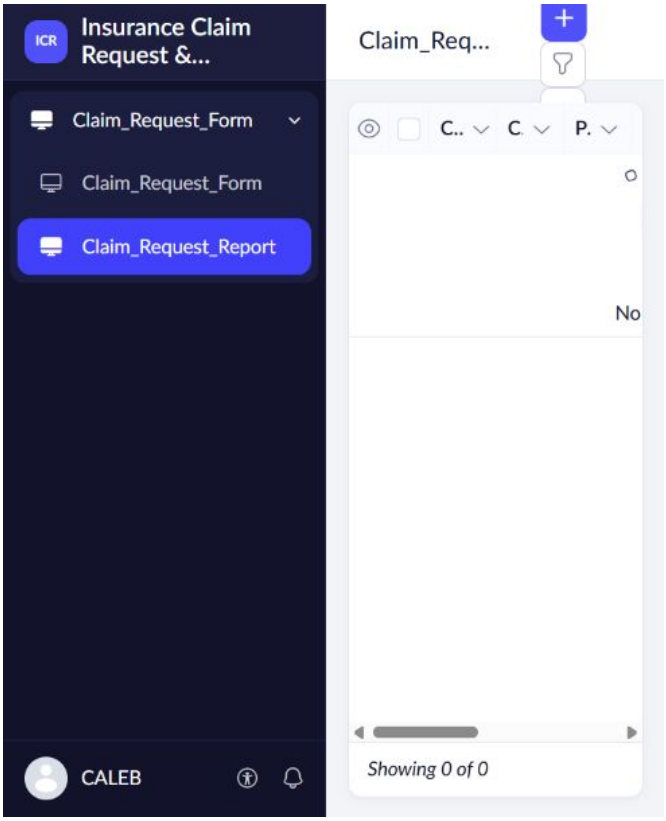

Figure 9. Policyholder session before submission: 0 of 0.

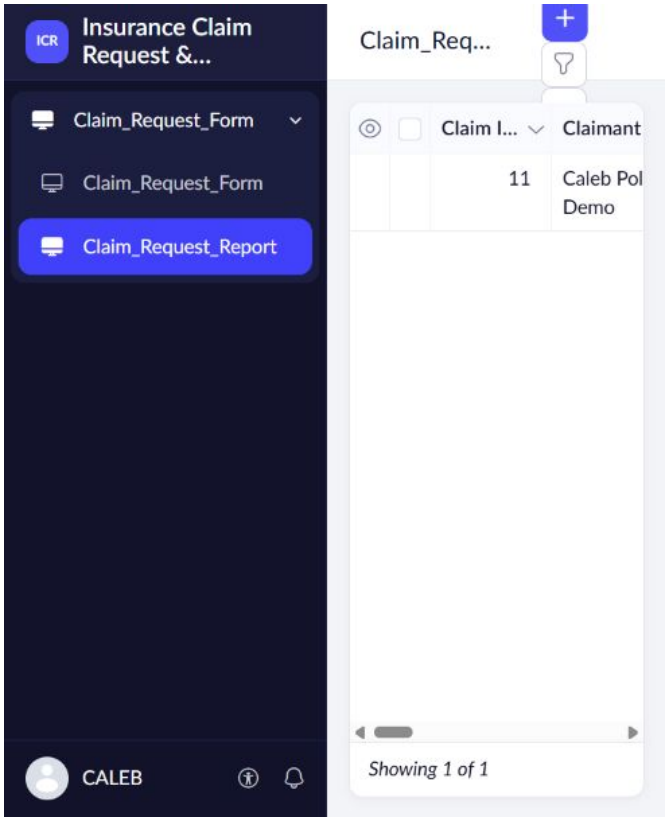

Figure 10. After submission: only own claim #11, 1 of 1.

10. Implementation Evidence - Runtime Restrictions

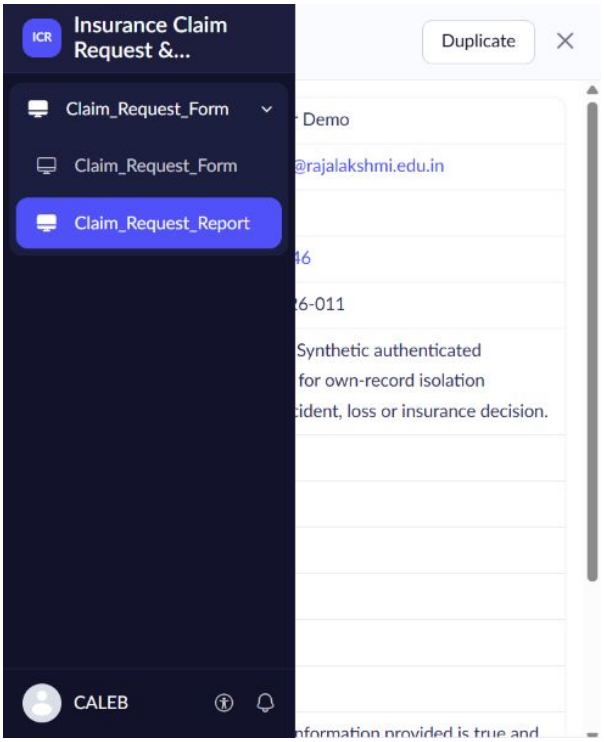

Figure 11. Own-record detail shows Duplicate but no Edit or Delete.

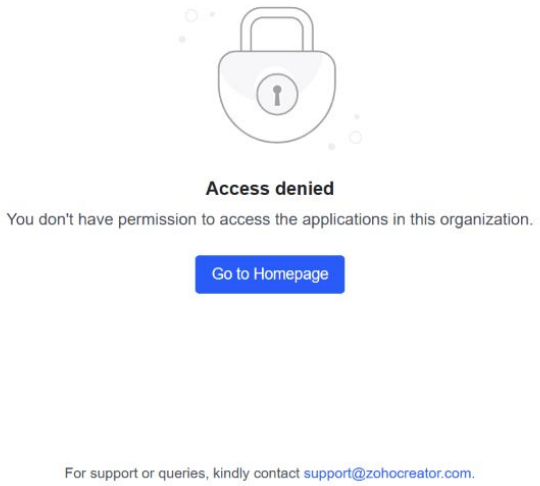

Figure 12. Policyholder direct administration access is denied.

10. Implementation Evidence - Restored Assignment

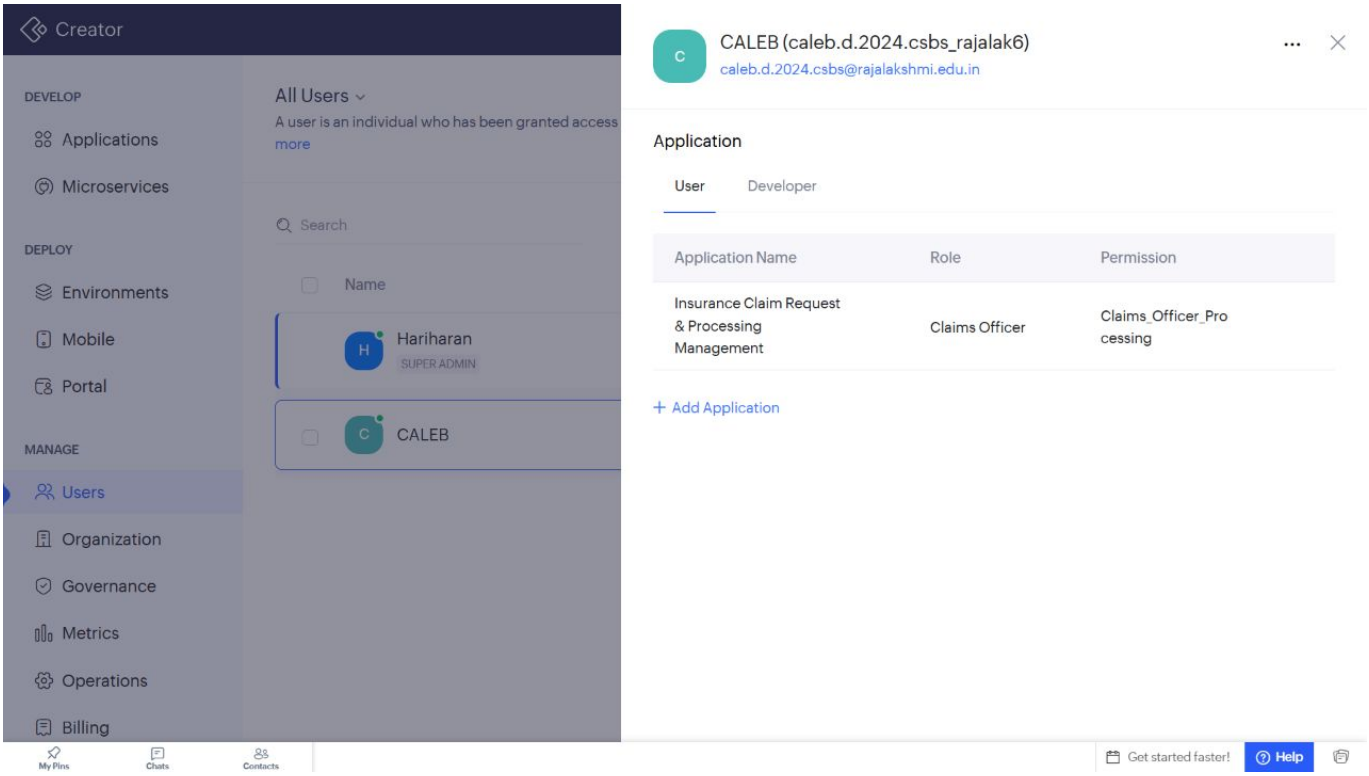

Figure 13. Final saved Caleb assignment: Claims Officer and Claims_Officer_Processing.

11. Expected Learning Outcomes

1. Distinguish roles, permission profiles and field permissions.

2. Apply least-required access for claimants and processing staff.

3. Verify ownership isolation using an actual separate login.

4. Restore temporary test assignments and retain evidence of final access.

12. Result

Administrator, Claims Officer and Policyholder roles and permissions were configured. Separate-login tests verified staff processing and policyholder own-record isolation. Caleb was restored to the original Claims Officer assignment after testing.

Conclusion

The application separates claim submission and status viewing from staff processing and owner administration, with actual test evidence for each access level.

Observed scope: The Policyholder dashboard direct-link test did not produce an explicit denial page; no dashboard data appeared. Staff-report and administration tests returned explicit errors. No permanent Policyholder account remains assigned after the approved temporary test.
